Performers Albums Singles Unreleased material In 2012 a story about Sezen Aksu and his brother Mert started spreading on the internet, claiming that Sezen Aksu had allegedly released his unreleased debut album *Tümül* which was never finished and did not receive a single release. A studio version of "Orospu", a Turkish song that was originally written for the Finnish language lyrics, was leaked by a Bulgarian source. Discography Studio albums Live albums EPs Collaboration albums Compilation albums Other albums References External links Official Website Sezen AksuThe present invention relates to the field of data processing, and more particularly to controlling the management of process inventory for a computer application program. In a large data processing system, process management is an important factor in the production and operation of the system. The process management is typically performed by a computer application program, such as a process manager program or process scheduler program, which includes a number of specific process control elements which are combined to perform a variety of process management functions, such as controlling and monitoring the interaction between various entities of the system, such as processes, tasks, jobs, etc. It is important that the process manager program efficiently performs its functions. However, the use of a large number of separate process control elements in the process manager program may cause the process manager program to perform inefficiently in certain situations, such as when the process manager program is performing multiple tasks at once. It is therefore desirable to provide the capability for the process manager program to perform multiple tasks at once, while at the same time reducing the amount of memory and processor time used by the process manager program for the performance of such tasks. Q: Stored procedure using cursors. Duplicate cursor? I wrote a stored procedure that uses a cursor to loop through each record of a table. I then take that data, and insert it into another table. The cursor works fine. However, if I run the procedure two times in a row, it creates 2 cursors in the first column of the second table. Is there any way around this? Here's the code for the stored procedure: SET ANSI_NULLS ON GO SET QUOTED_IDENTIFIER ON CREATE PROCEDURE [dbo].[UpdateTable 82157476af
